Marley Gray	Microsoft

Taxonomy Formula: [tF{~d,t,g,SC}+phSKU]

## **Token Specification Summary**

## Token Classification

Template Type:	SingleToken	This token has no sub or child tokens.
Token Type:	Fungible	Tokens have interchangeable value with one another, where any quantity of them has the same value as another equal quantity if they are in the same class or series.
Token Unit:	Whole	There can be many instances of this token, but they cannot be subdivided.
Value Type:	Reference	This token is a receipt or title to a material item, property or right. The token represents a reference to the value, can be owned or used digitally via its token. Sometimes referred to as a digital twin.
Representation Type:	Common	This token is simply represented as a balance or quantity attributed to an owner address where all the balances are recorded on the same balance sheet, like a bank account. All instances can easily share common properties and locating them is simple.

This is a Whole Token with Variable Supply Fungible where an initial supply can set at creation and then supply can be added and removed from the total based on need. It is Whole by setting the Decimals property on the subdividable behavior = 0. This token has the SKU PropertySet added to add specific SKU information to the Token Class. This token is delegable, meaning the owner of a

token(s) can allow another party to transfer or burn token instances on their behalf.

### Example

Inventory tokens to represent items in a SKU are a common use of this type of token. Representing inventory using fractional amounts like `.081231` does not make sense, so a point is just that a single whole unit.

Tracing ownership or the token and its removal from circulation when it used is.

## Analogies

Name	Description
Barrel of Oil	A producer can create a token for each barrel of oil, where the SKU represents the type of barrel it is. These barrels can change ownership and be burned when the barrel is refined or consumed in some way.

NOMY -

## Inventory is:

- Non-Subdividable
- Transferable
- Delegable
- Burnable
- Roles
- Mintable

## **Inventory Details**

## Whole Fungible

Type:	Base
Name:	Whole Fungible
ld:	b1eacdf8-35d8-454a-b1af-92eb0b6f45d4
Visual:	τ <sub>F</sub> { <i>&gt;^d</i> }
Tooling:	tF{~d}
Version:	1.0

## **Definition**

Whole Fungible tokens have interchangeable value with each other, where any owned sum of them from a class has the same value as another owned sum from the same class. A whole token cannot be sub-divided so it doesn't support the notion of 'making change'.

### **Example**

An inventory item or SKU, where an item is treated as a whole because it makes no sense to own a fraction of a SKU or loyalty point.

## **Analogies**

Name	Description
Loyalty Points	Most credit card or retail loyalty point programs deal with whole numbers so that redeeming points is easy to understand for their customers.
General Admission  Movie Ticket	Purchasing a general admission ticket to a movie only allows for you to have a seat, but the seat that you actually get depends on factors like when you arrive. Your not likely to want to share a seat with another adult.

Version:	1.0

## **Definition**

An ability or restriction on the token where it cannot be subdivided from a single whole token into fractions. Sets the base token Decimals property to 0 which will make the token non-sub-dividable and a whole token is the smallest ownable unit of the token.

### **Example**

Non-subdividable is common for items where subdivision does not make sense, like a property title, inventory item or invoice.

## **Analogies**

Name	Description
Non-Fractional	It is not possible to own a fraction of this token.
Barrel of Oil	Barrels of Oil don't make sense to subdivide.

ld:	a3d02076-6009-4a65-9ed4-2deffe5291e1
Visual:	<i>g</i>
Tooling:	g
Version:	1.0

## **Definition**

### Draft

A token class that implements this behavior will support the delegation of certain behaviors to another party or account to invoke them on the behalf of the owner. When applied to a token, behaviors that are Delegable will enable delegated request invocations. This is useful to provide another party to automatically be able to perform the behaviors that can be delegated without seeking permission up to a certain allowance.

## **Example**

## **Analogies**

Name	Description	
Broker	You may allow a broker to transfer your tokens as a part of an investment strategy. Setting an allowance can cap the total number of tokens the broker is allowed to perform delegated behaviors, when exceeded a new allowance request will need to be granted.	

## **Comments**

Applied to behaviors that are Delegable.

ld:	803297a1-c0f9-4898-9d44-29c9d41cca97
Visual:	<i>b</i>

Tooling: b

Version: 1.0

### **Definition**

A token class that implements this behavior will support the burning or decommissioning of token instances of the class. This does not delete a token, but rather places it in a permanent non-use state. Burning is a one way operation and cannot be reversed. This behavior is Delegable. If the token definition is Delegable, BurnFrom will be available.

### Example

When a token is used in a certain way, you may want to remove it from circulation or from being used again. Since the ledger doesn't allow for deletions, burning a token essentially 'deletes' the token from being used, but not from history.

## **Analogies**

Name	Description
Oil Barrels	If you mint a new token for each barrel of oil created, you may transfer ownership several times until the barrel is refined. The refining process should burn the barrel of oil to remove it from circulation.
Redeem	A token that is a coupon or single use ticket, should be burned when it is redeemed.

Visual:	<i>r</i>
Tooling:	
Version:	1.0

## **Definition**

A token can have behaviors that the class will restrict invocations to a select set of parties or accounts that are members of a role or group. This is a generic behavior that can apply to a token many times to represent many role definitions within the template. This behavior will allow you to define what role(s) to create and what behavior(s) to apply the role to in the TemplateDefinition.

### <u>Example</u>

## **Analogies**

Name	Description
Minters	A role called 'Minters' for a token can have accounts in the role. The MintTo behavior invocation will be bound to the role check to ensure only account in the 'Minters' role are allowed to mint new instances in the class.

### **Comments**

Roles has a constructor control that creates roles and applies them to certain behaviors of the token at creation of the class from the template.

## **Properties**

## Mintable

Туре:	Behavior Control of the Control of t
Name:	Mintable
ld:	f9224e90-3cab-45bf-b5dc-0175121e2ead
Visual:	<i>m</i>
Tooling:	m
Version:	1.0

## **Definition**

A token class that implements this behavior will support the minting or issuing of new token instances in the class. These new tokens can be minted and belong to the owner or minted to another account. This behavior may be invalidated by a restrictive behavior like Singleton, where only a single instance of the token can exist. Mintable is technically delegable, but it's delegation should be controlled by a behavior like Roles.

### **Example**

A consortium of oil producers needs to create tokens for each barrel of oil they are putting on the market to trade. There are separate classes of tokens for each grade of oil. Producers of barrels will need be have the ability to mint new tokens in order to facilitate the trading of them in the supply chain.

## **Analogies**

Name	Description
SKU	A token class can represent a particular item SKU, where the manufacturer of the item has the ability to mint or issue new inventory of the SKU into the supply chain.

### RoleCheck

Id: 00a665e3-1dda-441e-8262-5750435c153c

Description: Check to see if the account is in the Role called 'Minters'

### Request Message:

IsInRole

Description: Checking the 'Minters' role.

#### Request Parameters

Name	Value
AccountId	AccountId of the requestor.

#### Response Message

True/False

Description: Respond true if the account is in the 'Minters' role.

#### Response Parameters

Name	Value
IsInRole	True/False

#### MintTo

ld: 70499b23-a1dd-4c87-90d6-6e45400f28b5

Description: A request to create new token instances in the class by the owner or a party or account in a role that is granted this permission to another party or account. Requires a To and Quantity fields in the request.

### Request Message:

MintToRequest

Description: The request

### Request Parameters

Name	Value
ToAccount	Account Id to mint the tokens to.
Quantity	Number of new tokens to create.

### Response Message

MintTo Response

Description: The response

#### Response Parameters

Name	Value
Confirmation	A confirmation receipt or error may be returned to the invoker based
	on the outcome of the MintTo request.

#### Mint

Id: 3ddf15db-c919-4f72-a57b-d089931bc901

Description: A request to create new token instances in the class by the owner or a party or account in a role that is granted this permission. Minted tokens using this invocation will be owned by the owner or token pool account. Requires a Quantity field in the request.

#### Request Message:

MintRequest

Description: The request

### Request Parameters

Name	Value
Quantity	Number of new tokens to create.

NOMY

### Response Message

MintResponse

Description: The response

### Response Parameters

Name	Value
Confirmation	A confirmation receipt or error may be returned to the invoker based on the outcome of the mint request.

## **Properties**

## **Supply Control**

Туре:	BehaviorGroup
Name:	Supply Control
ld:	91cb89b6-a2ce-44ff-b3a0-f0cb3f117e56
Visual:	<i>SC</i>
Tooling:	SC
Version:	1.0

## **Definition**

A token class that implements this behavior will provide controls to increase and decrease supply of tokens within the class. Additionally, it will include the ability to support a role, like Minters, that will be allowed to invoke the Mintable behavior. The owner can add accounts to the role and any account that is a member of the role will be able to mint tokens in the class.

### **Example**

## **Analogies**

Name	Description
Central Bank	Implementing monetary policy for this token.

## Comments

Define a Minters role and apply the role to the mintable behavior.
